Compare two different proportional relationships represented in different ways. e.g., Compare a distance-time graph to a distance-time equation to determine which of two moving objects has greater speed.</p> <p><b>8.EE.6</b> Use similar triangles to explain why the slope <math>m</math> is the same between any two distinct points on a non-vertical line in the coordinate plane; derive the equation <math>y=mx</math> for a line through the origin and the equation <math>y=mx+b</math> for a line intercepting the vertical axis at <math>b</math>.</p> <p><b>Cluster(s): Analyze and solve linear equations and pairs of simultaneous linear equations.</b></p> <p><b>8.EE.7</b> Solve linear equations in one variable.</p> |                                    |                       |  |

**EE.7.a Recognize when** linear equations in one variable have one solution, infinitely many solutions, or no solutions. Give examples and show which of these possibilities is the case by successively transforming the given equation into simpler forms.

**EE.7.b** Solve linear equations with rational number coefficients, including equations whose solutions require expanding expressions using the distributive property and combining like terms.

**Note:** This includes equations that contain variables on both sides of the equation.

**8.EE.8** Analyze and solve pairs of simultaneous linear equations.

**EE.8.a** Understand that solutions to a system of two linear equations in two variables correspond to points of intersection of their graphs, because points of intersection satisfy both equations simultaneously. **Recognize when the system has one solution, no solution, or infinitely many solutions.**

**EE.8.b** Solve systems of two linear equations in two variables **with integer coefficients: graphically, numerically using a table, and algebraically.** Solve simple cases by inspection.

e.g.,  $3x + y = 5$  and  $3x + y = 6$  have no solution because  $3x + y$  cannot simultaneously be 5 and 6.

**Notes:** Solving systems algebraically will be limited to at least one equation containing at least one variable whose coefficient is 1.

**Algebraic solution methods include elimination and substitution.**

**This standard is a fluency expectation for grade 8. For more guidance, see Fluency in the Glossary of Verbs Associated with the New York State Next Generation Mathematics Learning Standards.**

**8.EE.8c** Solve real-world and mathematical problems involving systems of two linear equations in two variables with integer coefficients. **Note:** Solving systems algebraically will be limited to at least one equation containing at least one variable whose coefficient is 1.

| <b>Unit 4: Ready Classroom</b><br><br><b>Functions</b><br><br><i>Linear and Nonlinear Relationships</i>  | <b>8<sup>th</sup> Grade</b> | <b>6 weeks</b> | <b>SCSD</b><br><br><b>Math 2020</b> |
| <b>Domain(s): Functions</b>  |                             | <b>8.F</b>     |                                     |
| <b>Essential Question(s):</b> How can we model the relationship between quantities?<br><br>What is the best model for mathematical communication?  |                             |                |                                     |
| <b>Cluster(s):</b><br><br><i>Define, evaluate, and compare functions.</i><br><br><b>F.1</b> Understand that a function is a rule that assigns to each input exactly one output. The graph of a function is the set of ordered pairs consisting of an input and the corresponding output.<br><br>Notes: Function notation is not required in Grade 8.<br><br><b>The terms domain and range may be introduced at this level; however, these terms are formally introduced in Algebra I (AI-F.IF.1).</b><br><br><b>F.2</b> Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions).<br><br>e.g., Given a linear function represented by a table of values and a linear function represented by an algebraic equation, determine which function has the greater rate of change.<br><br>Note: Function notation is not required in Grade 8.<br><br><b>F.3</b> Interpret the equation $y = mx + b$ as defining a linear function, whose graph is a straight line. Recognize examples of functions that are linear and non-linear. |                             |                |                                     |

e.g., The function  $A=s^2$  giving the area of a square as a function of its side length is not linear because its graph contains the points (1,1), (2,4), and (3,9), which are not on a straight line. *Note: Function notation is not required in Grade 8.*

***Use functions to model relationships between quantities.***

**F.4** Construct a function to model a linear relationship between two quantities. Determine the rate of change and initial value of the function from a description of a relationship or from two (x, y) values, including reading these from a table or from a graph. Interpret the rate of change and initial value of a linear function in terms of the situation it models, and in terms of its graph or a table of values.

**F.5** Describe qualitatively the functional relationship between two quantities by analyzing a graph. Sketch a graph that exhibits the qualitative features of a function that has been described **in a real-world context**.  
e.g., where the function is increasing or decreasing or when the function is linear or non-linear.

Work with radicals and integer exponents.<br><p><b>NS.1</b> Understand informally that every number has a decimal expansion; for rational numbers show that the decimal expansion eventually repeats. Know that other numbers that are not rational are called irrational. <b>NS.2.</b> Use rational approximations of irrational numbers to compare the size of irrational numbers, locate them approximately on a number line diagram, and estimate the value of expressions.</p> <p><b>NS.2</b> Use rational approximations of irrational numbers to compare the size of irrational numbers, locate them approximately on a number line, and estimate the value of expressions.</p> |                       |         |                  |

**EE.2** Use square root and cube root symbols to represent solutions to equations of the form  $x^2 = p$  and  $x^3 = p$ , where  $p$  is a positive rational number. **Know square roots of perfect squares up to 225 and cube roots of perfect cubes up to 125. Know that the square root of a non-perfect square is irrational.**

e.g., The  $\sqrt{2}$  is irrational.

***Understand and apply the Pythagorean Theorem.***

**8.G.6 Understand** a proof of the Pythagorean Theorem and its converse.

**8.G.7** Apply the Pythagorean Theorem to determine unknown side lengths in right triangles in real-world and mathematical problems in two and three dimensions.

**8.G.8** Apply the Pythagorean Theorem to find the distance between two points in a coordinate system.

**8.G.9 Given** the formulas for the volume of cones, cylinders, and spheres, solve mathematical and real-world problems.

***Solve real-world and mathematical problems involving volume of cylinders, cones and spheres.***

**8.G.9 Given** the formulas for the volume of cones, cylinders, and spheres, solve mathematical and real-world problems.
